PT New isolated haemopoletin receptor - used for developing products pr for modulating proliferation, differentiation and survival of cells, PT for medulating proliferation, differentiation and survival of cells, PT e.g. neuronal cells

PT e.g. neuronal cells

CC claim 16; Page 90-92; 182pp; English.

CC Interaction between the novel HR and a ligand facilitates proliferation, cells and survival of a wide variety of cells. The HR and it's CC differentiation and survival of a wide variety of cells. The HR and it's CC different cells and tissues in vitro and in vivo in an array of CC different cells and tissues in vitro and in vivo. They can be present in CC cens the composition of the products can also be used for detection and diagnosis, CC e.g. for cancers or predisposition to cancers, or for drug screening.

Description

acid sequences zeri

haemopoietin

score c Pred. No.

No. is the number of results greater than or equal to the derived by analysis of the t

total

predicted by chance to have a score of the result being printed, total score distribution.

The NR6 protein is a novel Haemopolettin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis,
                                                  Claim 1; Page 89-90; 55pp; English.
The present sequence represents a Zcytor5 variant protein. Zcytor5 is a cytokinin-like receptor. Soluble Zcytor5 may be administered down-regulate the effects of a growth and/or maintenance factor thyroid, heart, and skeletal muscle for example to lessen the elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo

                  thyroid, heart, and skeletal muscle for example to lessen the of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the pres and integrity of the Zcytor5 gene on chromosome 19. Antibodies anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.
                                                                                                                                                                                                                                                              The present sequence represents a 2cytor5 variant protein. Zcytor5 is a cytokinin-like receptor. Soluble Zcytor5 may be administered down-regulate the effects of a growth and/or maintenance factor in
                                                                                                                                                                                                                                                                                                                                                                                    New mammalian cytokinin-like receptor Zcytor5 - useful for, down-regulating Zcytor5 natural ligands or detecting cardiot in blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zcytor5; cytokinin-like receptor; down-regulation; growth

A pro 2cytor5 DNA or RNA can be used to determine the 1ty of the 2cytor5 gene on chromosome 19. Antibodiypic antibody could be used to purify 2cytor5 and 2cally to modify 2cytor5 ligand effects.

                                                                                                                                                                                                                                                                                                                                                                                                  down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart blood, and to discover other possible Zcytor5 ligands. A probe and integrity of the Zytor5 could be used to detect cardiotrophin-1 in the comprising Zcytor5 DNA or RNA can be used to detectmine the presence and integrity of the Zytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            is a cytokinin-like receptor. Soluble Zcytor5 may be administered t down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.

                                                                                                  Claim 1; Page 96-97; 55pp; English. Zcytor5 variant protein. Zcytor5 The present sequence represents a Zcytor5 may be administered to is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.
                                                                                                                                                                                                                                                                                                                                                                                (ZYMO ) ZYMOGENETICS INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 or cardiac pathologies, so preventing heart enlargement. Zeytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.

                                                                                                                                                                                                                                             The present sequence represents a Ecytor5 variant protein. Zcytor5 is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-l on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-l in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human Zcytor5 variant. Zcytor5 is a Cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to moddify Zcytor5 ligand effects.

The present sequence represents a Zoytor5 variant protein. Zcytor5 (CC is a cytokinin-ilke receptor. Soluble Zcytor5 may be administered to CC down-regulate the effects of a growth and/or maintenance factor in CC of cardiotrophin-1 on cardiac pathologies, so preventing heart CC enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the CC comprising Zcytor5 DNA or RNA can be used to determine the probe CC and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the Integrity of the Zcytor5 gene on chromosome 19. Antibodies and the CC anti-idiotypic antibody could be used to purify Zcytor5 and the Zcytor5 ligand effects.

The present sequence represents a Zcytor5 variant protein. Zcytor5 is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.

                                                                                                                                                                                                                                 The present sequence represents an allelic varaint of protein designated Zcytor5, which is a cytokinin-like receptor. Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance effect in thyroid, heart, and skeletal muscle for example to lessen the enlargement. Zcytor5 could be used to detect cardiotrophin-l in cardiac pathologies, so preventing heart blood, and to discover other possible Zcytor5 ligands. A probe and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the anti-idiotypic antibody could be used to purify Zcytor5 and the presence anti-idiotypic antibody could be used to purify Zcytor5 and the sequence 425 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     different texts and transcribed for modulating neuronal proliferation, differentiation, and diagnosis, and survival. The products can also be used for detection and diagnosis, and servival are products can also be used for detection and diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The haemopoletin receptor (HR) NR6.1 is a form of the novel HR NR6. Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in the process of the control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       29-SEP-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        for modulating proliferation, e.g. neuronal cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   367 RRELKOFLGWLKKHAYCSNLSFRLYDOWRAWMOKSHKTRNOV

Prove isolated haemopoletin receptor - used for developing products for modulating proliferation, differentiation and survival of cells, e.g. neuronal cells.

The e.g. neuronal cells

Claim 15; Page 84-87; 182pp; English.

The haemopoletin receptor (HR) NR6.2 is a form of the novel HR NR6.

Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, sequence 425 AA;

Sequence 425 AA;
